THE JOURNAL OF PHYSIOLOGY
JUNE 1957. VOL. 137, NO. 1

SIMONS, J. R. The blood pressure and the pressure pulses in the arterial arches of the frog (Rana temporaria) and the toad (Bufo bufo).

ECCLES, J. C., ECCLES, ROSAMOND M. and LUNDBERG, A. The convergence of mono-synaptic excitatory afferents on to many different species of alpha motoneurones.

DOWNMAN, C. B. B. and EVANS, M. H. The distribution of splanchnic afferents in the spinal cord of cat.

RODDIE, I. C., SHEPHERD, J. T. and WHELAN, R. F. Humoral vasodilatation in the forearm during voluntary hyperventilation.

BEAULNES, A. and DAY, MARGARET. Effect of temperature on arrhythmia in isolated rabbit atria.

MARGOLIS, J. Initiation of blood coagulation by glass and related surfaces.

MAURICE, D. M. The exchange of sodium between the vitreous body and the blood and aqueous humour.

FERNANDEZ DR MOLINA, A and GRAY, J. A. B. Activity in the dorsal spinal grey matter after stimulation of cutaneous nerves.

VOGT, W. The chemical nature of Darmstoff.

Subscription price 80s. net per volume of 3 parts

During the past 25 years knowledge of brain function has advanced strikingly. Information gathered in laboratories and clinics has revealed many new facts, and in general the data has been published only in specialized journals. Progress has been so rapid that the non-specialist has inevitably been left behind, and even those whose work deals with the brain may know little of related disciplines.

This book is intended to fill the gap between the physiologist on the one hand and the clinician and psychologist on the other. It is a full account of the functions of the nervous system. Throughout, the approach has been to select those points most likely to assist in the application of laboratory methods to the study of the human subject in health and disease. The stress has been placed upon dynamic rather than morphological concepts. Particular emphasis has been placed upon the importance of a knowledge of the special senses in interpreting symptomatology and disordered perceptions. The psychologist will find the fullest account readily available of the neural mechanisms of the cerebral cortex.
